* Plug-in API * .NET API * Custom Application Programming Interfaces (APIs) * Visual LISP API * AutoLISP API
The .NET API is implemented using the Managed Extensions feature of the .NET Framework. Visual LISP can be implemented as a plugin or as a Visual LISP API. The Visual LISP plugin is available for Windows and Mac. The .NET API does not support macros and there are limitations on the language features that can be used. The .NET API is available for the following file formats: * AutoCAD DWG, DXF, and SAT files * Other CAD files that can be read by .NET The AutoLISP API is part of the AutoCAD Application Programming Guide (APG). The plugin works in a similar way to the Visual LISP plugin and is also available for Windows and Mac. AutoLISP supports: * Macros and custom functions * VBA function libraries * Create and evaluate AutoLISP forms * The PL/Plus language There are also a number of other API's, including Visual LISP, which are based on .NET. a1d647c40b

Biochemical and histological evaluation of freeze-dried cell suspensions of human peripheral blood lymphocytes: a comparison of the cryopreservation and cyroprotectant storage solutions. The usefulness of freeze-dried cell suspensions of human peripheral blood lymphocytes was evaluated in immunodeficient mice. After rehydration, cell suspensions were frozen using two different freezing solutions, namely, 10% polyvinylpyrrolidone (PVP) or 8.5% polyvinylpyrrolidone and glycerol, and a cyroprotectant solution (15% sucrose, 5% DMSO, 1% alanine, and 2.5% PVP). Freeze-dried cell suspensions were subjected to freezing, thawing, and rehydration steps, followed by in vitro stimulation of lymphocytes with concanavalin A (ConA) in the presence or absence of cyclosporin A. Lymphocytes frozen with PVP-based freezing solution, regardless of addition of cyroprotectant, were morphologically more damaged than cells frozen with glycerol-based solution. The lymphocytes frozen with PVP-based solution plus sucrose as a cyroprotectant showed the most improvement in survival rate. In addition, PVP-based solution plus sucrose provided more viable cells than glycerol-based solution plus sucrose. There were no differences in lymphocyte proliferation activity between cells frozen with glycerol-based solution and PVP-based solution. As a result, PVP-based solution may be a more suitable freezing solution than glycerol-based solution. These results also indicate that a combination of PVP-based solution and sucrose as a cyroprotectant is the best method for freeze-drying of lymphocytes for clinical use.
