The present invention relates to a system and method for monitoring inventory levels of various items. More specifically, the invention relates to a system and method for the secure transmission of information regarding inventory of various items over a network such as the Internet. Businesses often rely on a system for tracking inventory items. For example, a business may track items that are sold in the business""s retail stores. For example, a business may utilize a computer system for tracking inventory that is sold in its retail stores. The computer system may include a network of local computers, including servers, client computers, and the like. Each computer may be connected to a local network for communication between the various computers. Additionally, the local computers may be connected to a global computer network, such as the Internet, for further communication between computers. Tracking inventory is challenging, especially when the inventory to be tracked includes a large quantity of items, such as perishable goods. For example, a business that sells food may rely on a tracking system that tracks the inventory of food items. An inventory tracking system that is used to track perishable goods should include an automated system that tracks the inventories of the perishable goods as they are being sold. Additionally, the system should not require constant manual intervention by a human. Furthermore, an inventory tracking system should be able to track the inventory of various items that are of a varying quality and have a varying shelf life. For example, a monitoring system for tracking perishable items should have the ability to identify inventory shortages and/or overages of certain items. Many systems for tracking inventory are not secure. Accordingly, systems for tracking inventory over a network such as the Internet are not secure. For example, conventional inventory tracking systems rely on an administrator to manually verify information that is gathered regarding inventory items. As a result, such systems do not provide an adequate level of security to prevent fraudulent activities from being perpetrated against the business. There is, therefore, a need for a system and method for the secure transmission of information regarding inventory of various items over a network such as the Internet. There is also a need for a system and
