The application is based on the idea that: 1. Line comments are different from the rest of the code; 2. Line comments are not grouped together, however they are more prominent than other comments in the lines; 3. The grouping of the code can be applied to every language. To achieve the goal of making this application the best, the developers have created a website where people can suggest improvements and bugs. As of the time of this writing, the URL is tokei.org. The main advantages of this method are that it allows the developers to give more relevant feedback and that it can eventually promote the application among users. Currently, Tokei is able to handle about 150 languages, including various programming languages, but it can also support various dialects. As its name suggests, the application can recognize the C++ dialect and can even sort the output grouped per project. To start with the application, one can open up the website and simply type in the language they wish to inspect. Once a language is selected, one can either go straight for the main page or move to the application's main page. The latter one allows the developers to see the statistics of the language and has various helpful information that a user can read. Tokei also allows the user to switch languages. This can be done by simply clicking on the language that the developer is currently using. The application then gathers the statistics based on the current language selected. At the same time, it will keep updating the statistics if the user selects a new language. There is a quick way of getting the application to read from the command line. The main page has various flags that can be used to make the application do something else. The application's configuration can be altered via command-line arguments. According to the developer, one thing the tool cannot do is go through the code one by one and identify which lines are not worth noting and which ones should. That said, the tool can also add a comment to the output, which is something the developer hopes to do in the future. Sample Output: As mentioned above, the sample output displayed on the website is of someone using C++. As seen above, the application has recorded a lot of information that can be read very `77a5ca646e`
